

Session recap — T115 Student Risk and Intervention Briefing, Thursday 01 Oct 2026

18:13–21:02 AEST · 2h 48m · Feature-005 (US-28)

In one line: US-28 (Enhanced Student Risk Visualisation) was specified, built, tested, merged, published and evidenced. The dashboard and the advisor page now use the same risk labels, colours, chart order and explanations. **US-28 is complete in the repository; one re-publish of the dashboard remains.**

Scope note: as requested, this recap covers only project work and decisions. Tooling, login and other workflow issues are left out. Updated at 21:02 to tick off the remaining steps from the first version of this recap.

Timeline

Time	Phase	What happened
18:13	Scoping	You gave the US-28 brief; the repository was reviewed; you answered 13 planning questions
18:43	Rules and approvals	Risk labels set to "At Risk" / "Not At Risk"; edits to teammates' files approved
18:49	Specification and build	Spec written; dashboard, advisor badge, score ring and dashboard tests changed in parallel
19:24	Documentation and hand-off	Traceability record, teammate change log and publish steps finished; first pull request opened
20:08	Publish and verify	First pull request merged; dashboard published and checked from screenshots
20:36	Follow-up fix and close-out	Summary card edge recoloured and merged; app redeployed; final evidence recorded

Human overviewer — direction and decisions

Direction given

- 18:13 — Build US-28 as Feature-005 using spec-driven development, on a new branch.
- 18:43 — Use "At Risk" / "Not At Risk" across the whole application and dashboards. "High" / "Low" date from an earlier three-level design and are now obsolete.
- 18:45–18:49 — The team has approved edits to Karen's dashboard tests, Lu's advisor-page styling and the dashboard. Log every such change so it can be reverted if a teammate objects.
- 19:28 — Keep revert routes in the documentation only, with no extra code.
- 20:15 — Keep a backup copy of the old dashboard in Databricks for the team before replacing it.
- 20:36 — The advisor page should not use red and green for the risk categories anywhere.
- After 21:02 — Show 16 characters of the Student ID, and let advisors enter that Student ID in the app instead of the full hash.

Decisions made

Time	Decision	Why it mattered
18:31–18:36	Branch from the latest shared main; change both the dashboard and the advisor page; two categories split at 50%; keep the dashboard blues; order and label the score buckets; add a guide panel plus chart descriptions; US-28 only; full spec flow (mostly AI's recommended options)	Settled the scope and the visual design

Time	Decision	Why it mattered
19:02–19:08	Recolour the score circle as a blue ring (AI's recommended option); confirmed the dashboard as own work	Matched the circle to the badge
20:08	Merged the first pull request	Put Feature-005 on main
20:23	Published the updated dashboard and captured screenshots 1–4	Human verification of the live dashboard
20:37	Summary card edge follows the category, on a new branch (AI's recommended options)	Removed the last red element beside the blue badge
20:41	Merged the follow-up pull request and redeployed the advisor app	Made the new colours live
21:02	Captured screenshot 5 from the deployed app	Final evidence for US-28

Checks and corrections

- 18:43 — Overrode the earlier "High Risk / Low Risk" wording choice with "At Risk / Not At Risk".
- 20:36 — Spotted that the deployed app still showed red and green; this led to the redeploy and the summary card fix.

AI agents — workload

Main agent

- 18:16–18:38 — Found that US-28 targets the dashboard, mapped the current labels and colours, and flagged that renaming the badge would break a teammate's test.
- 19:24–19:29 — Recorded the score-ring decision, wrote the traceability record and change log, tested both revert routes, and ran the final checks.
- 20:23 — Checked screenshots 1–4 against the US-28 checklist. All passed, and the chart order worked live.
- 20:33 — Found that 8-character student IDs on the dashboard are not unique (about 110–130 shared pairs); full IDs are.
- 20:37–20:40 — Recoloured the summary card edge, added tests and updated the spec documents.
- 21:02 — Recorded screenshot 5 and closed the final task.
- After 21:02 — Changed the dashboard Student ID from 8 to 16 characters, so each ID identifies one student. Updated Karen's dashboard tests to match, added a check that the IDs are unique, and recorded the change in the spec.
- After 21:02 — Let advisors retrieve a student in the app by the dashboard's 16-character Student ID (the full hash still works). Changed the advisor page wording from "deidentified student hash" to "Student ID", updated three of Karen's interface checks to match, and confirmed the shorter ID is no weaker for privacy.

Subagents

Agent / track	Job	Ran	Result
Repository review	Read docs, git state and the dashboard	18:13–18:16	Summary used to plan
Track A	Specification documents	18:49–18:59	Committed; no critical issues

Agent / track	Job	Ran	Result
Track B	Dashboard labels, colours, order, guide panel and descriptions	19:00–19:02	Committed
Track C	Advisor badge recolour plus new tests	19:00–19:05	Committed
Track D	Update Karen's dashboard tests and add offline checks	19:03–19:05	Committed

AI decisions

- Picked a dark text colour for the light-blue badge, because white text would be too hard to read.
- Set the lint target to "no new findings", because 4 older findings sit outside this feature.
- Made the summary card fix directly rather than with a subagent, because the change was small.

You gave 20 project prompts and answered 18 project questions; the AI ran 5 subagents and made 17 commits.

Outcomes

- ☒ Dashboard uses "At Risk" / "Not At Risk" only, with one colour per category on every chart, ascending score buckets, a guide panel and chart descriptions. Verified by 25 offline checks and by the published dashboard screenshots.
- ☒ Advisor badge, score ring and summary card edge use the dashboard blues. Verified by tests and by screenshots from the deployed app.
- ☒ Test suite: 299 passed, 13 skipped (live checks that need the workspace), 0 failed, after the follow-up fix.
- ☒ Every edit to teammates' work (five entries) is logged with revert steps in the documentation only.
- ☒ Both pull requests merged into main (20:08 and 20:41).
- ☒ All five evidence screenshots captured from the live dashboard and app, and recorded.
- ☒ Dashboard Student ID now shows 16 characters, so IDs are unique. Verified by offline tests: 300 passed, 14 skipped, 0 failed.
- ☒ The advisor app accepts the dashboard Student ID and says "Student ID" throughout. Verified by tests: 306 passed, 14 skipped, 0 failed.
- ☐ The 16-character Student ID and the new lookup are not live until the dashboard is re-published and the app redeployed.

What's next

#	Task	Who	Status	Source
1	Publish the dashboard in place and check the chart order	You	☒ Done 20:23	First recap
2	Capture the five evidence screenshots and record them	You and AI	☒ Done 21:02	First recap
3	Approve the pull request merge into main	You	☒ Done 20:08, follow-up 20:41	First recap
4	Push the evidence record (final task ticked) to the shared repository	You	☒ Done, pull request opened	This session
5	Remove the leftover helper copies of the repository	AI	☒ Done	Session plan
6	Show 16 characters of the student ID on the dashboard so IDs are unique (shared IDs	AI	☒ Done in the repository, added to US-28; tests pass	AI finding, 20:33

#	Task	Who	Status	Source
	drop from about 110 pairs to effectively none)			
7	Let advisors enter the dashboard Student ID in the app, with "Student ID" wording	AI	✅ Done in the repository; tests pass	Your request
8	Merge the close-out pull request, re-publish the dashboard, redeploy the app, and check one Student ID end to end	You	Waiting on you	Spec task list

Waiting on others: none.
