

Session recap — T115 capstone, US-29 dashboard filtering, Sun 04 – Mon 05 Oct 2026

15:39–03:46 AEST · 12 h 7 min · branch agent/claude-coder-mutdg3d2

In one line: US-29 (dashboard-wide filters, click-to-filter charts and "Students in this view" tables) was designed, built, checked by the human in Databricks over three rounds, reviewed three times by Codex and approved with notes. Nothing is pushed.

Timeline

Time	Phase	What happened
15:39	Design	The first run was cancelled because it guessed answers. On the rerun, 14 questions went to the human, who answered them at 16:15. The design document was committed at 16:20
20:18	Design review fixes and build	All 5 Codex design findings were fixed, and the human answered Q16–Q20. The feature was built and committed at 20:38
20:45	Code review round 1	CODE-01 to CODE-03 were fixed by 21:30. The "Ignored filters" setting was not available, so the human chose observe-first
02:25	Workspace rounds 2–4	The human checked the dashboard in Databricks. Their results led to decisions Q23–Q27: two empty filters were removed, the enrolment fields were joined into the prediction data, and the charts were rebound. All rows passed or were accepted by 03:34
03:39	Code review rounds 2–3	Two findings (R2-01, R2-02) were fixed at 03:42. Round 3 closed both and approved with notes
03:45	Close-out	The orchestrator asked for this recap

The chat was compacted at 21:04 and 03:44; those stretches come from the session summaries and the timeline.

Human overviewer — direction and decisions

Direction given

- 20:35 — Told the AI to create the throwaway "format probe" dashboard itself.
- 21:15–21:28 — Tried the workspace editor and the Databricks assistant for "Ignored filters", reported that neither offered it, and told the AI to go ahead with observe-first.
- 02:31–03:33 — Ran the workspace checklist three times and sent back notes and results. One round's notes were a PDF.

Decisions made

Time	Decision	Why it mattered
16:15–20:31	Q1–Q20, mostly the AI's recommended options	Set the scope, the filter fields and the sensitive-data rules; approved editing teammates' tests
20:50–21:28	Q21 = a, then Q22 = a, then observe-first	No guessed setting went into teammates' charts; checklist row B7 checks clicks on the Gender column
02:31	Q23 = a, Q24 = a: remove filters that error or show only empty values	Faculty and Study Mode filters removed; 6 filters remain
02:40	Q25 = a (AI's recommended option)	Enrolment fields joined into the prediction data, because this edition of Databricks cannot link two datasets for filtering

Time	Decision	Why it mattered
02:45 (via orchestrator)	Keep the "US29 format probe" dashboard	Its deletion is no longer pending
03:20	Q26 = a (AI's recommended option)	Charts rebound to the joined data so chart clicks stop erroring
03:34	Q27 = a	B7 accepted: clicking a row narrows to that one student, never to a gender group

Checks and corrections: the first run was cancelled. At 21:16 the AI's directions pointed to the wrong menu and a probe chart's type was changed; the AI corrected the directions. At 03:33 the human corrected a result label from B5 to B7.

You sent 24 direct messages and made 28 decisions. The AI received 10 orchestrator dispatches, ran 1 subagent and made 13 commits.

AI agents — workload

Main agent

- 16:20–20:38 — Wrote and amended the design documents, then built the filters, three drill-down tables sorted highest risk first, a Gender Breakdown page and a help panel. Repaired 24 outdated teammate tests.
- 20:48–21:30 — Fixed CODE-01 to CODE-03.
- 02:34–03:23 — Removed the two empty filters, joined the enrolment fields into the prediction data, rebound the charts, and updated two teammate items (logged as teammate changes 4 and 5). Every change was checked against live data with read-only queries only.
- 03:42 — Fixed R2-01 with a test that runs the real dataset query on sample data, and fixed R2-02 by aligning the documents with Q24–Q27.

Subagents

Agent / track	Job	Ran	Result
Kickoff repo read	Read the repo and its ownership records	15:59–16:00	Found no owner recorded for US-29

AI decisions: the AI refused to write a guessed "Ignored filters" setting. It made no writes to the Databricks workspace beyond the approved probe. It kept its scratch scripts outside the repo.

Outcomes

-  353 tests passed, 14 skipped, 0 failed. Codex reproduced this.
-  The linter shows only the warning that existed before; Codex reproduced this.
-  15 of 15 deliberately injected faults were caught; Codex independently replayed 5.
-  Codex round 3: approved with notes, 0 findings open.
-  Workspace checklist (as recorded by the human): every A row, B1–B6, C1–C4, D1, D2 and D4 passed. B7 was accepted under Q27, and D3 does not apply.
-  Codex did not reproduce the workspace results. The sample-data test does not prove Databricks behaves the same, that course keys are unique, or how ties are broken when two records share a census date and year.

What's next

#	Task	Who	Status	Source
1	Approve the push and pull request	You	 Completed: you approved it, and the AI pushed the branch and opened pull request 132 at 03:56. It is not merged	Orchestrator's pull request request

#	Task	Who	Status	Source
2	Add the session recaps to the repo	You	✅ Completed by decision: you add the recaps yourself, so the AI did not commit them	Orchestrator's recap instructions
3	Review and merge pull request 132 (this also closes the US-29 backlog item)	You	🔴 Open: waiting on your manual review	Floor rules

Waiting on others: none.
