

Session recap — T115 Student Risk and Intervention Briefing, Thursday 01 Oct 2026

18:13–21:51 AEST · 3h 38m · Feature-005 (US-28)

In one line: US-28 (Enhanced Student Risk Visualisation) was specified, built, tested, merged, published and verified. The dashboard and the advisor app now use the same risk labels, colours, chart order, explanations and de-identified Student ID. **US-28 is complete.**

Scope note: as requested, this recap covers only project work and decisions. Tooling, login and other workflow issues are left out. Final version, 21:51.

Timeline

Time	Phase	What happened
18:13	Scoping	You gave the US-28 brief; the repository was reviewed; you answered 13 planning questions
18:43	Rules and approvals	Risk labels set to "At Risk" / "Not At Risk"; edits to teammates' files approved
18:49	Specification and build	Spec written; dashboard, advisor badge, score ring and dashboard tests changed in parallel
19:24	Documentation and hand-off	Traceability record, teammate change log and publish steps finished; first pull request opened
20:08	Publish and verify	First pull request merged; dashboard published and checked from screenshots
20:36	Follow-up fix and evidence	Summary card edge recoloured and merged; app redeployed; all five screenshots recorded
21:11	Student ID	Dashboard Student ID lengthened to 16 characters; app retrieves students by it; labelled "Student ID (de-identified)"; merged, re-published, redeployed and confirmed working

Human overviewer — direction and decisions

Direction given

- 18:13 — Build US-28 as Feature-005 using spec-driven development, on a new branch.
- 18:43 — Use "At Risk" / "Not At Risk" across the whole application and dashboards. "High" / "Low" date from an earlier three-level design and are now obsolete.
- 18:45–18:49 — The team has approved edits to Karen's dashboard tests, Lu's advisor-page styling and the dashboard. Log every such change so it can be reverted if a teammate objects.
- 19:28 — Keep revert routes in the documentation only, with no extra code.
- 20:15 — Keep a backup copy of the old dashboard in Databricks for the team before replacing it.
- 20:36 — The advisor page should not use red and green for the risk categories anywhere.
- 21:11 — Show 16 characters of the Student ID on the dashboard, as part of US-28.
- 21:14 — Let advisors enter the Student ID from the dashboard in the app, instead of the full hash.
- 21:22 — Label it "Student ID (de-identified)" on the dashboard and in the app.

Decisions made

Time	Decision	Why it mattered
18:31–18:36	Branch from the latest shared main; change both the dashboard and the advisor page; two categories split at 50%; keep the dashboard blues; order and label the score buckets; add a guide panel plus chart descriptions; US-28 only; full spec flow (mostly AI's recommended options)	Settled the scope and the visual design
19:02–19:08	Recolour the score circle as a blue ring (AI's recommended option); confirmed the dashboard as own work	Matched the circle to the badge
20:08	Merged the first pull request	Put Feature-005 on main
20:23	Published the updated dashboard and captured screenshots 1–4	Human verification of the live dashboard
20:37	Summary card edge follows the category, on a new branch (AI's recommended options)	Removed the last red element beside the blue badge
20:41	Merged the follow-up pull request and redeployed the advisor app	Made the new colours live
21:02	Captured screenshot 5 from the deployed app	Final evidence for the visual changes
21:22	Chose "Student ID (de-identified)" as the label (AI's suggested wording)	Stops anyone mistaking it for a real student number
21:10, 21:30	Merged the close-out pull requests	Put the evidence and Student ID changes on main
21:51	Re-published the dashboard, redeployed the app and confirmed a Student ID retrieves the right student	End-to-end check that US-28 works

Checks and corrections

- 18:43 — Overrode the earlier "High Risk / Low Risk" wording choice with "At Risk / Not At Risk".
- 20:36 — Spotted that the deployed app still showed red and green; this led to the redeploy and the summary card fix.
- 21:20–21:21 — Questioned whether a de-identified hash or a student ID is better for privacy, and whether the dashboard holds real IDs. This led to the "(de-identified)" label.

AI agents — workload

Main agent

- 18:16–18:38 — Found that US-28 targets the dashboard, mapped the current labels and colours, and flagged that renaming the badge would break a teammate's test.
- 19:24–19:29 — Recorded the score-ring decision, wrote the traceability record and change log, tested both revert routes, and ran the final checks.
- 20:23 — Checked screenshots 1–4 against the US-28 checklist. All passed, and the chart order worked live.

- 20:33 — Found that 8-character Student IDs on the dashboard are not unique (about 110–130 shared pairs); full IDs are.
- 20:37–20:40 — Recoloured the summary card edge, added tests and updated the spec documents.
- 21:02 — Recorded screenshot 5 and closed the evidence task.
- 21:11–21:13 — Changed the dashboard Student ID from 8 to 16 characters, updated Karen's dashboard tests, and added a check that the IDs are unique.
- 21:14–21:18 — Let the app retrieve a student by the 16-character Student ID (the full hash still works), changed the advisor page wording, updated three of Karen's interface checks, and confirmed the shorter ID is no weaker for privacy.
- 21:22–21:24 — Applied the "Student ID (de-identified)" label on the dashboard and throughout the app, with tests.

Subagents

Agent / track	Job	Ran	Result
Repository review	Read docs, git state and the dashboard	18:13–18:16	Summary used to plan
Track A	Specification documents	18:49–18:59	Committed; no critical issues
Track B	Dashboard labels, colours, order, guide panel and descriptions	19:00–19:02	Committed
Track C	Advisor badge recolour plus new tests	19:00–19:05	Committed
Track D	Update Karen's dashboard tests and add offline checks	19:03–19:05	Committed

AI decisions

- Picked a dark text colour for the light-blue badge, because white text would be too hard to read.
- Set the lint target to "no new findings", because 4 older findings sit outside this feature.
- Made the later fixes directly rather than with subagents, because each change was small.
- Kept accepting the full hash in the app alongside the Student ID, so existing links and the API keep working.
- Treated a Student ID shared by two students as "not found" rather than guessing.

You gave 31 project prompts and answered 18 project questions; the AI ran 5 subagents and made 20 commits.

Outcomes

- ☒ Dashboard uses "At Risk" / "Not At Risk" only, with one colour per category on every chart, ascending score buckets, a guide panel and chart descriptions. Verified by offline checks and the published dashboard screenshots.
- ☒ Advisor badge, score ring and summary card edge use the dashboard blues. Verified by tests and screenshots from the deployed app.
- ☒ The dashboard shows a 16-character "Student ID (de-identified)" that is unique per student, and advisors can paste it into the app to retrieve that student. Verified by tests and by your end-to-end check at 21:51.
- ☒ Final test suite: 307 passed, 14 skipped (live checks that need the workspace), 0 failed.
- ☒ Every edit to teammates' work is logged with revert steps in the documentation only.
- ☒ All pull requests merged into main: #120 (20:08), #121 (20:41), #122 (21:10) and #123 (21:30).
- ☒ All five evidence screenshots captured from the live dashboard and app, and recorded.

What's next

#	Task	Who	Status	Source
1	Publish the dashboard in place and check the chart order	You	☒ Done 20:23	First recap

#	Task	Who	Status	Source
2	Capture the five evidence screenshots and record them	You and AI	✓ Done 21:02	First recap
3	Approve the pull request merge into main	You	✓ Done 20:08, follow-up 20:41	First recap
4	Push the evidence record to the shared repository	AI	✓ Done, merged 21:10	This session
5	Remove the leftover helper copies of the repository	AI	✓ Done	Session plan
6	Show 16 characters of the Student ID on the dashboard so IDs are unique	AI	✓ Done, merged 21:30	AI finding, 20:33
7	Let advisors enter the dashboard Student ID in the app, labelled "Student ID (de-identified)" everywhere	AI	✓ Done, merged 21:30	Your request
8	Re-publish the dashboard, redeploy the app, and check one Student ID end to end	You	✓ Done 21:51	Spec task list

Nothing is left for US-28.

Waiting on others: none.
